

Business Problem Statement

Xiaomi is one of the leading smartphone brands in India, operating in a highly competitive market with changing customer preferences, regional demand variations, and multiple sales channels. To maintain market leadership and improve business performance, Xiaomi needs data-driven insights into its sales operations.

The objective of this project is to analyse Xiaomi mobile sales data across different cities, customer age groups, mobile models, payment methods, and time periods. The analysis aims to identify top-performing products, understand customer purchasing behavior, evaluate customer satisfaction through ratings, and uncover sales trends that drive revenue growth.

Using SQL for data analysis and Power BI for visualization, this dashboard provides actionable insights that help answer key business questions such as:

- Which Xiaomi mobile models generate the highest revenue?
- Which cities contribute the most to sales?
- What customer segments are the most profitable?
- Which payment methods are preferred by customers?
- How do sales vary across months and days?
- Which products receive the highest customer ratings?

The insights derived from this analysis can support strategic decision-making in inventory planning, marketing campaigns, customer targeting, and overall business growth within the Indian smartphone market.
